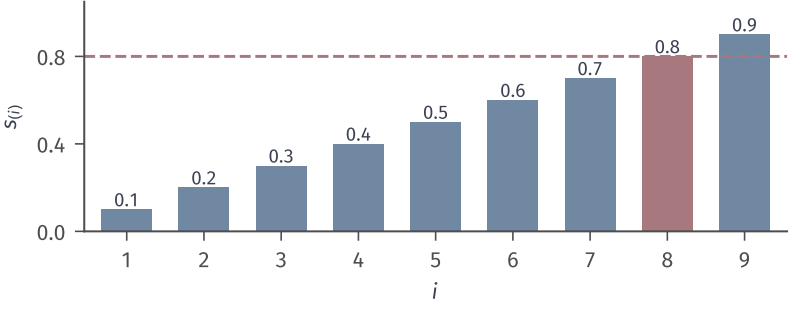
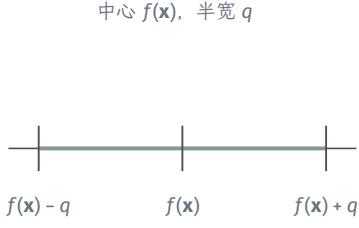
独立训练
固定模型 f

校准 $n = 9, \alpha = 0.2$
$s_i = |y_i - f(\mathbf{x}_i)|$

排序取阈值
$k = 8,\ q = s_{(8)} = 0.8$

新输入 $\mathbf{x}$
构造区间 $C(\mathbf{x})$





$$C(\mathbf{x}) = [f(\mathbf{x}) - q, f(\mathbf{x}) + q]$$
